

## UC 1- Customer Places an Order

### Design Decisions

#### **Frontend Decisions**

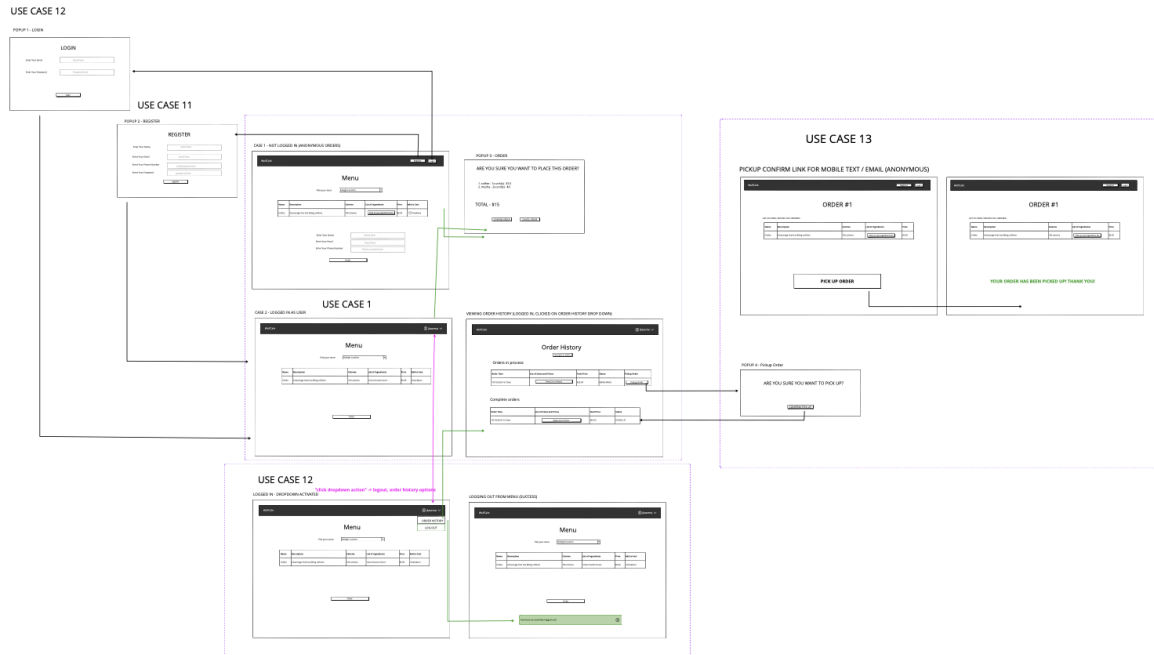

For the front end, we decided to organize the layout similar to the previous project (Coffee Maker) because it felt easy to follow. We organize the menu items in a list, and we have a pop-up if the user wants to see the ingredient list (for example, if the user has allergies). We also have a checkbox if the user wishes to add a certain menu item to the cart, giving the user the ability to add multiple items to the cart. Additionally, if the user is an “anonymous user,” we add a section below the menu table where the user has to enter some information so they can place an order properly.

#### **Backend Decisions**

For the back end, we decided to refactor our MakeRecipeController class and turn it into a MakeOrderController class. This would allow us to be able to now take a list of recipes/items in order to follow through on an order. The user would now submit the list of things they would like to purchase, as well as the amount paid, and it will be passed to the backend and determine whether or not there are enough ingredients in stock, as well as if the user paid enough money for the purchase.

#### **Front-end Design Elements**

Original Design

Updated Design  
(Same as original)

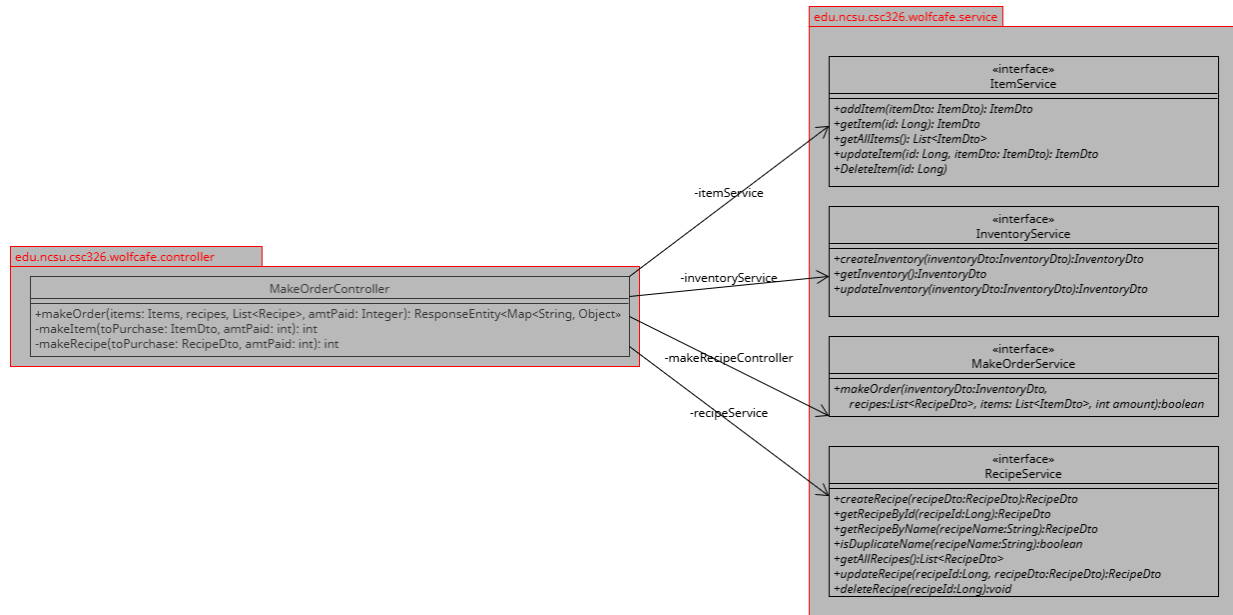

Changelog

- Since it's iteration 1A we did not change anything

## **Backend Elements**
