

UC 6- Fulfill an Order

Design Decisions

Frontend Decisions

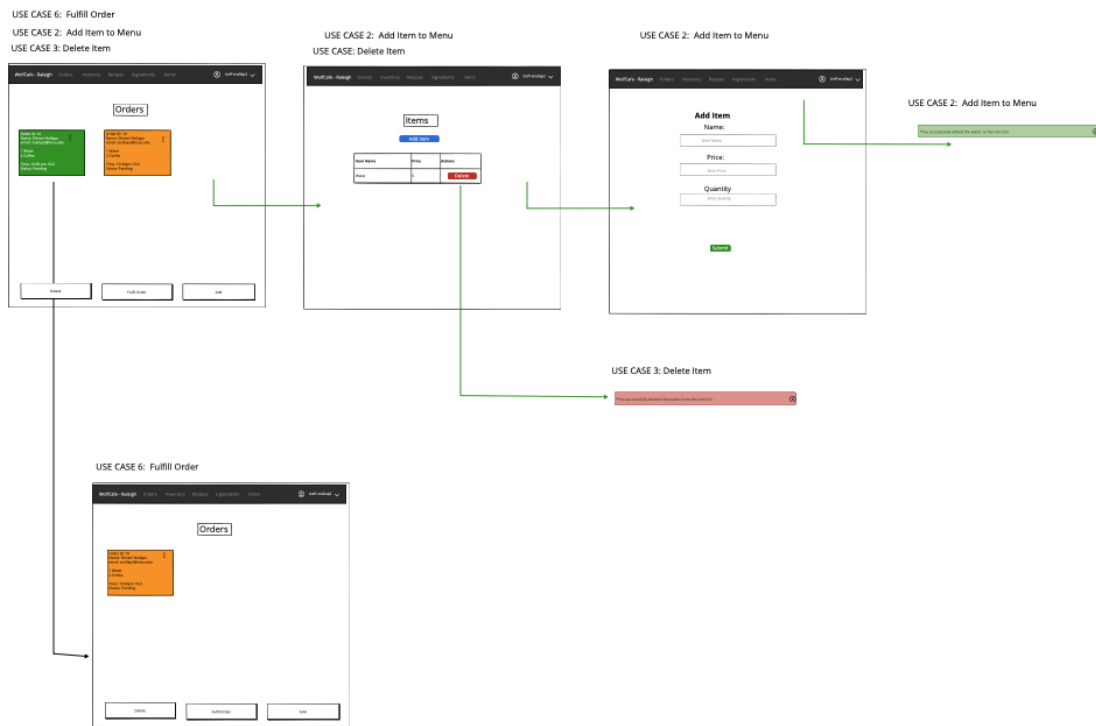

We made the order pages the default pages for the staff view of the system because we felt these pages will likely be the most used. Each order is displayed in a box with the appropriate information, and each box is color-coded. By using shapes and colors, it will be easier for the staff to differentiate between orders. At the bottom of the screen, there are three buttons: delete, fulfill order, and add, which are used for the three main actions the staff can take. By placing the buttons together at the bottom, staff members can access these actions quickly.

Backend Decisions

For fulfilling an order, we decided it would be a good idea to make a new controller class. While it technically could have gone into the MakeOrder class, we felt like it would be better to separate these two functions since one should be available to customers, while another should be available to staff. So while an order in progress is required to fulfill an order, they should exist as separate actions and the actions should live in separate entities.
