

UC 2-Add Item to Menu

Design Decisions

Frontend Decisions

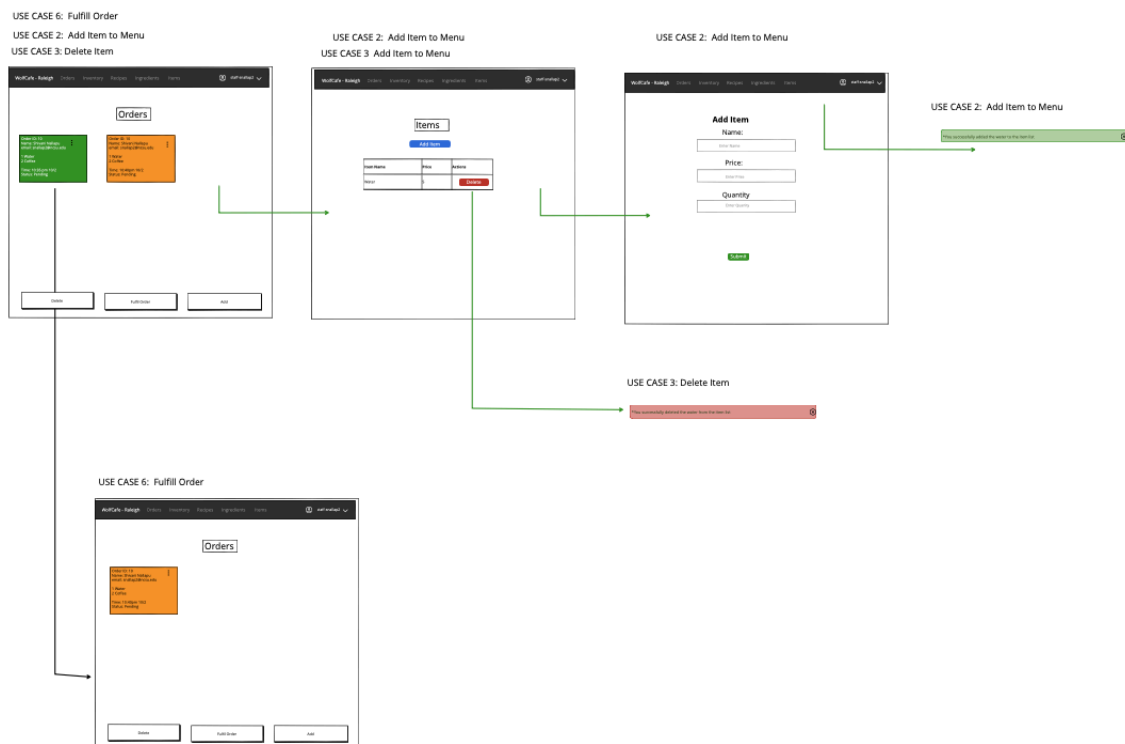

The default pages for the application on the staff side are the order pages because we felt these are the pages the staff will interact with the most. In addition to the order pages, we added the following tabs: Orders, Inventory, Recipes, Ingredients, and Items to fulfill all our use cases on the staff side. The add items path and display are almost the same as the add ingredients path because we believe consistency in a system is important. We use color, words, and symbols for success and error messages to accommodate visually impaired users.

Backend Decisions

All this one took was again, refactoring the original RecipeController class to now support Items to it. Now a staff member can submit a request to actually add an item to the menu through the ItemController, which should be a page on the frontend. Other than this, it should follow the same path as addRecipe did in the onboarding project, where it navigates to a service and an item is eventually placed into a repository.
